

Foundation for burial pole

Remember to check if the pole and foundation match!

1 First release the area around the selected location for mud, tiles or other things.

Mark the desired location for the burial pole as the center of the hole.

2. Then excavate the hole for the burial pole at least 40cm larger than the cross section of the pole.

(eg Pole D = 11.4cm cause a hole of about 52x52cm.)

The hole should be 10cm deeper than the height of the burial pole to make room for a well-graded bedding layer and even it out.

3. Add the bedding layer. (eg Place the burial pole on the center of the bedding layer, which is vertically aligned afterwards.)

Make sure the burial mark "NGR" flushes the surface level.

Important!

In order to provide a correct and stable foundation, the NGR mark on the burial pole must be placed maximum 10cm above the terrain.

5. if necessary, pull cables through the cable hole for light connection in the pole.

6. Then fill the hole with base course, which is compressed per 30 cm

"Ensured the burying pole is vertically aligned, after the compression"

The pole excavation is completed, after the last compression.
